Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Composition containing antagonist of growth factor GP88 - useful for treating cancer and viral diseases and also for diagnosing disease

us-09-824-647-4.rag

```
ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bioactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises, this ET-1 activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR1432
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      à
                                                                                                         GP88 is an 88
                                                                            This is the amino acid sequence of peptide P12T, comprising amino acid residues P208-T219 of murine GB88 (see AAM85474). GP88 is an 88 kba glycoprotein autocrine growth factor that is expressed in a tightly requiated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the rumorigenic cells. P12T was used in an attempt to raise neutralising antibodies to GP88 (see also AAW85478-79). Antagonists to GP88, such as anti-GP88 antibodies, are used to treat diseases associated with increased expression of GP88, particularly cancer but also viral infections. Anti-GP88 antibodies can also be used and diagnostic reagents and to deliver toxins or other compounds to

This is the amino acid sequence of murine GP88, an 88 kDa glycoprotein autocrine growth factor and epithilin/granulin precursor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. Inhibition of GP88 compared in the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing cells. Murine GP88 cDNA (see AAV82824) was obtained from the highly tumorigenic PC cell line. Antagonists to GP88 are used to treat classes associated with increased expression of GP88, particularly cancer but also viral infections. Fragments of GP88 are used to rease specific antibodies (used as antagonists, as diagnostic raspents and for delivering toxins or other compounds to GP88. Cexpressing cells) and to screen for antibodies. Methods are provided for diagnosing disease, or determining susceptibility to disease, resulting from altered GP88 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mouse; granulin precursor; GP88; cytostatic; tumourigenicity; tamoxifen; antineoplastic; antioestrogen therapy; skin cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bloactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises this ET-1 activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human. The method comprises obtaining a biological sample containing cells from the patient, detecting GPB8 in the cells of the sample, and determining the number of GPB8 positive cells in the sample, and determining the number of GPB8 positive cells in the sample, and determining the ratio of GPB8 positive cells to the total number of cells in the sample. The invention also relates to a method for determining in the sample. The invention also relates to a method for determining anticostrogen therapy. The method is useful for diagnosing tumourigenicity in a sample, such as blood, serum, plasma, urine, nipple aspirate, cerebrospinal fluid, liver, kidney, breast, bone, brain, lung, colon, or skin cancer. The method can be used to treat or prevent re-occurrence of cancer in a patient, by administering tamoxifen if the sample contains less than 10 % GPB8, or less than 5 % GPB8 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                             ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bioactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatows extivity characteristic of ET-1 and, in fact, antagonises this ET-1 activity. The method comprises obtaining a biological sample containing cells from the patient, detecting 6P88 in the cells of the sample, and determining the number of GP88 positive cells in the sample, and determining the ratio of GP88 positive cells to the total number of cells in the sample. The invention also relates to a method for determining if a human patient is resistant to the antineoplastic effects of antioestrogen therapy. The method is useful for diagnosing tumourigenicity in a sample, such as blood, serum, plasma, urine, nipple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       precursor; GP88; cytostatic; tumourigenicity; tamoxifen; antioestrogen therapy; skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing tumorigenicity in a human, comprising obtaining a cell sample, detecting GP88 in the cells, and determining the number of GP88 positive cells in the sample –

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antianglogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions.
aspirate, cerebrospinal fluid, liver, kidney, breast, bone, brain, lung, colon, or skin cancer. The method can be used to treat or prevent re-occurrence of cancer in a patient, by administering tamoxifen if the sample contains less than 10 % GPB8, or less than 5 % GPB8 positive cells. The present sequence is human granulin/epithelin precursor (GPB8)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnosis; cytostatic; prolliferative; vulnerary; immunomodulator; antidibabetic; antishmatic; antichematic; antiathritic; antidiral; antidibabetic; antidatritic; antidiral; antidibamatory; antithyroid; antiallergic; antibacterial; cardiant; dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antianglogemic; gene therapy; inflammation; immune disorder; haematopoletic cell disorder; autoimmune disorder; all disorder;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by practicals, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory cannows system, however it is particularly involved in the inflammatory sample with a blinding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The can blinding agent that binds to the production of antibodies and determining the amount of bound protein in the sample. The collypeptides may be used as antigens in the production of antibodies of therefore treat P. acnes proteins: These antibodies can be used to downregulate expression and activity of P. acnes pripeptides and ctherefore treat P. acnes infections: The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by contine the sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPPO CC at fitp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                            Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating ache vulgaris -

SEQ ID No 3255; 1069pp; English. Claim 3;

polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. scnes is also involved in infections of bone, joints and the central controls system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to convergulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bateman A., Belcourt D.R., Bennett H.P., Lazure C., Solomon S., "Granulins, a hovel class of peptide from leukocytes."; Biochem. Biophys. Res. Commun. 173:1161-1168(1990).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: GRANULIAN HAVE FUSSIBLE LITUALINE-LIKE ACTIVITY. THEY MAY PLAY A ROLE IN INFLAMMATION, WOUND REPAIR, AND TISSUE REMODELING.

-!- FUNCTION: GRANULIN A PROMOTES PROLIFERATION OF THE EPITHELIAL

CELL LINE A431 IN CULTURE WHILE GRANULIN B ACTS AS AN ANTAGONIST
TO GRANULIN A, INHIBITING THE GROWTH.

-!- GRANULIN A, INHIBITING THE GROWTH.

-!- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.

-!- TISSUE SPECIFICITY: IN MYELOGENOUS LEUKEMIC CELL LINES OF PROMONOCYTIC, PROMYELOCYTIC, AND PRORYTHROID LINEAGE, IN FERSENT IN INFLAMMATORY CELLS AND BONE MARROW. HIGHEST LEVELS IN KIDNEY.

-!- PTW: GRANULINS ARE DISULFIDE BRIDGED.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EXTRACELLULAR INVERTASE.
-!-CATALITIC ACTIVITY: Hydrolysis of terminal-non-reducing 2,1- and 2,6-linked beta-D-fructofuranose residues in fructans.
-!- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by an amide bond (Potential).
-!- INDUCTION: BY SUCRASE, FRUCTAN SUBSTRATES AND FRUCTOSE.
-!- SIMILARITY: BELONGS TO FAMILY 32 OF GLYCOSYL HYDROLASES.

Proc. Natl. Acad. Sci. U.S.A. 91:1519-1523(1994).

-!- FUNCTION: MAY SERVE AS A DOCKING SITE IN THE RECEPTOR-MEDIATED

IMPORT OF SUBSTRATES ACROSS THE NUCLEAR PORE COMPLEX.

-!- SUBUNIT: HONODIMER. INTERACTS WITH DDX19.

-!- SUBCELLULAR LOCATION: NUCLEAR PORE COMPLEX. CYTOPLASMIC FILAMENTS.

-!- TISSUE SPECIFICITY: EXPRESSED IN THYMUS, SPLEEN, BONE MARROW,

KIDNEY, BRAIN AND TESTIS, BUT HARDLY IN ALL OTHER TISSUES OR IN

WHOLE EMBRYOS DURING DEVELORMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "The translocation (6,9), associated with a specific subtype of acute myeloid leukemia, results in the fusion of two genes, dek and can, and the expression of a chimeric, leukemia-specific dek-can mRNA."; Mol.
